Determining Distribution Coefficient K

Different concentrations of acetic acid in water (prepared as detailed in procedure) was contacted with kerosene, 25 mL of each phase. A 5 mL sample of aqueous phase was titrated with 0.3 M NaOH. Amount required for titration provided below:

| Conc. AA [M] | 0.5 | 0.4 | 0.3 | 0.2 | 0.1 |
|--------------|-----|-----|-----|-----|-----|
| Volume 0.3 M | 6.9 | 5.5 | 4.1 | 2.9 | 1.4 |
| NaOH added | | | | | |
| [mL] | | | | | |

Pump calibration

The amount of water expelled in one minute was recorded below for both pumps #1 and #2:

| Pump speed [%] | 25 | 30 | 35 | 40 | 45 | 50 |
|--------------------------------------|-----|-----|-----|------|------|------|
| Pump 1 water collected [mL] | 671 | 802 | 962 | 1040 | 1240 | 1270 |
| Pump 2 water collected [mL] | 628 | 784 | 909 | 1010 | 1230 | 1250 |

Effect of flow rate on contactor

The contactor, operating at 3000 RPM and variable flow rates, had inlet streams of DI water and ?? M AA in kerosene (assumed 0.1 M). Samples were taken of the aqueous phase exit stream and 50 mL of said sample was titrated with 0.1 M NaOH. Volumes required to neutralize are given below:

| Pump Speeds | 30 | 35 | 40 | 45 | 50 |
|--------------|-----|-----|-----|-----|-----|
| [%] | | | | | |
| Volume 0.1 M | 3.7 | 3.3 | 2.9 | 3.0 | 3.7 |
| NaOH added | | | | | |
| [mL] | | | | | |

Effect of rotor speed on contactor

Contacting 0.1 M AA in kerosene with DI water at 30% flow rates and specified RPM. Aqueous exit stream sample of 5 mL was titrated with 0.1 M NaOH, volume required to neutralize given below.

| RPM | 3500 | 3000 | 2500 | 2000 | 1500 | 1000 |
|-----------------|------|------|------|------|------|------|
| Volume of 0.1 M | 6.3 | 5.1 | 4.2 | 5.0 | 4.0 | 4.1 |
| NaOH [mL] | | | | | | |
